SUMMARY

Backend engineer in production since 2017. For the last four years I have built payment, billing and subscription systems in Go on AWS for a platform that runs 100M+ Lambda invocations a month. With no formal tech lead role on the team, I acted as backend lead reporting to the CTO: I set the team's Go standards, write the specs, and take the production problems nobody owns.

EXPERIENCE

Software Engineer · *Personare*

Jun 2022 – Present · Rio de Janeiro, RJ (remote) · promoted Jan 2026

- Acted as backend lead on an engineering team of up to 10, reporting directly to the CTO. Bootstrapped the Go backend monorepo and its conventions (spec-first workflow, dependency boundaries, 80% coverage gates, OpenAPI contract tests), which the team adopted as its standard.
- Ran the spike, wrote the stories and led the migration of ~15 payment and cart APIs from a PHP monolith to Go on AWS Lambda in 8 weeks, redesigning a rigid API contract with no rollback needed. Infrastructure cost fell ~30% and read routes went from ~3 s to p50 ~5 ms. Checkout now serves ~10M requests and ~11k paid orders a month across card, Pix, PayPal, Apple Pay and Google Pay.
- Moved post-purchase work (confirmation email, analytics, Salesforce sync) off the critical path onto EventBridge and SQS with DLQs, so a downstream failure never blocks a purchase and failed events can be replayed. Added idempotency to retried flows and a transactional outbox for product events.
- Designed and shipped invoice issuing on Brazil's national e-invoice system (NFS-e) ahead of its 2026 legal deadline, with Finance and Product: direct API integration with signed XML, A1 certificates, retries and cancellation. It issues ~11k invoices a month (115k+ so far) with 0.03% left pending.
- Root-caused a 27% drop in an email alert product sending ~2.2M emails a day within 3 hours of detection (cache TTL out of step with the recalculation cycle), recalculated 1.25M users, wrote the postmortem, and fixed 167k profiles that were silently computed from out-of-sync data.
- Introduced alarms as code (errors, latency, memory, log-based metrics) across 12+ services, where detection used to depend on users complaining, and later removed ~107 noisy alarms so the remaining ones get acted on.
- Hardened payment and account security: stopped a legacy card vault from retaining PAN and CVV, fixed open-redirect and authorization flaws, audited XSS and IAM access (revoked admin access no longer needed across 11 AWS accounts), and led the same-day patch of a critical PHP-FPM RCE in production.
- Moved a legacy WordPress commerce service from a single EC2 host in a separate account (rsync deploys, no rollback) to ECS Fargate and Aurora Serverless v2 with Terraform, runbooks and a rehearsed rollback, cutting over in a 20-minute window.
- Initiated and co-led the new internal admin (Next.js, plus Go on 15 Lambdas with an audit trail) that replaces the legacy one and gives Support, Marketing and Product self-service over subscriptions, offers and coupons. Took the most support escalations on the team's current board.
- Cut AWS spend by measuring before cutting: RDS −35% while keeping high availability, CloudFront/WAF −$115/month, plus a costed backlog of further savings. Mentored teammates new to Go and started the team's Go study group.

Software Developer · *Mundiware*

Nov 2017 – Jun 2022 · Rio de Janeiro, RJ

- Promoted from web design technician to software developer within a year.
- Migrated the ad management system behind the print classifieds of 5+ newspapers and the online classifieds of 3+ from Visual Basic to C#/.NET Core on the web, on SQL Server.
- Built ETLs that import ads from several suppliers into the online classifieds, and the TV ad management module.
- Extended the in-house template language to simplify web development and lighten rendering. Trained two web designers.

Freelance Web Developer · *Self-employed*

2015 – 2022 · São Gonçalo, RJ

Websites and web apps for small businesses, owning scope, deadlines and delivery.

SELECTED PROJECTS

- **Diário SG** (diariosg.com.br): Go pipeline that OCRs São Gonçalo's official gazettes into ~162,000 searchable acts with Postgres full-text search, cross-checks companies against public data, emails alerts and exposes an MCP server with 12 tools. Event-driven worker with DLQs; runs on free tiers.

- **Morada:** condominium management with Pix payments, in use by a 12-unit building. TypeScript, Hono, Postgres; 900+ tests behind an 80% coverage gate.
- **Longa** (app.longa.run): running app that rewrites the training plan from what you actually ran. Go API, Expo/React Native, Stripe.

TECHNICAL SKILLS

Languages	Go (primary), TypeScript / Node.js, PHP, C#
Payments	card gateways (Cielo, Getnet, Pagar.me, Stark Bank), Pix, PayPal, Stripe, Apple Pay, Google Pay, NFS-e
AWS	Lambda, SAM, AppSync, EventBridge, SQS, SNS, SES, ECS Fargate, Aurora, RDS, DynamoDB, CloudFront, WAF, CloudWatch
Infra & Data	Terraform, CloudFormation, Docker, GitHub Actions, PostgreSQL, MySQL, Redis
Practices	clean architecture, event-driven design, idempotency, transactional outbox, TDD, spec-first, observability
AI tooling	Claude Code, Cursor, MCP servers

LANGUAGES

Portuguese (native) · English (fluent)
